

Environmental Management Systems

Environmental impact and performance is a growing concern today more than ever. EMS is a process used to manage, review, correct and improve an organization's operations. An environmental management system is a way to incorporate environmental considerations into daily operations to promote and improve the environment and human health. The internationally-accepted standard ISO 14001:2004 is designed to address the balance between maintaining profitability and reducing environmental impact.

Participants of these courses will receive training and direction from industry specific professionals with many years experience within Environmental Management. Along with industry related discussions, EMS courses like other courses offered by CMSI include in-class exercises and discussions.

Note: All auditor courses include written examination upon completion of course to validate student competency. Exams are 30 minutes to 2 hours in duration.

ENVIRONMENT MANAGEMENT

Understanding ISO 14001:2004	\$550	1 Day
ISO 14001:2004 Internal Environmental Systems Auditor	\$1100	3 Days
